

Instructions for Earwax Softening Drops

Earwax softening drops are a safe, non-irritating way to remove excessive earwax buildup. They produce a gentle microfoam cleaning action, which may create a mild bubbling or crackling sounds as they work. Regardless of whether you hear these sounds or not, the drops are working. As the wax softens, you might notice a decrease in your hearing and your ear may temporarily feel plugged. This is normal. If you wear hearing aids, avoid using them immediately after using drops, as some of the liquid may get into your hearing aid.

Place 5 - 10 drops in the affected ear(s) twice a day. For best results, lay on your side with the ear you placed drops facing upward for ten minutes. If you feel comfortable doing so, gently flush the ear with warm water afterward. Do not use hot or cold water to flush the ear, as it may cause dizziness. Refer to package directions for full details.

Caution: Do not use if you have a known perforation in your eardrum. Discontinue use if any pain occurs.

Administer drops to: Right Ear Only Left Ear Only Both Ears
